Setting up email

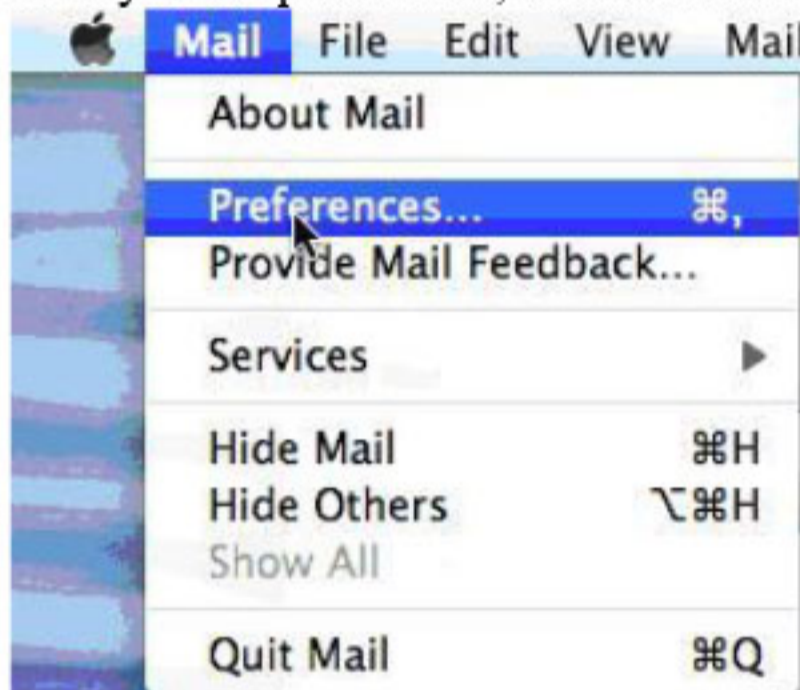

How to setup email on
Mac OS X 10.5

Telkom

Mail Settings in Mac OS X 10.5

This tutorial will show you how to change the settings for your mail account within OS X's built-in mail program, Mail. The version used to make this tutorial is version 3.2.

1. Once you've opened Mail, click on the menu labeled "Mail," and select "Preferences."

2. Next, you're presented with a window which contains three tabs, "Account Information," "Special Mailboxes," and "Advanced." First, let's look at the "Account Information" tab.
 - The "Account type" was determined when you set up the account. You cannot change it unless you delete this account and create a new one. The account type is "POP."
 - "Description" can be whatever you like, but it is recommended that you use something descriptive. This is just the description listed in Mail's list of email accounts.
 - "Email Address" should be your telkomsa.net email address.
 - "Full Name" can be your name, or whatever text you'd like to be seen as your name when you send email.
 - "Incoming Mail Server" should be "pop3.telkomsa.net"
 - "User Name" should be your telkomsa.net login name

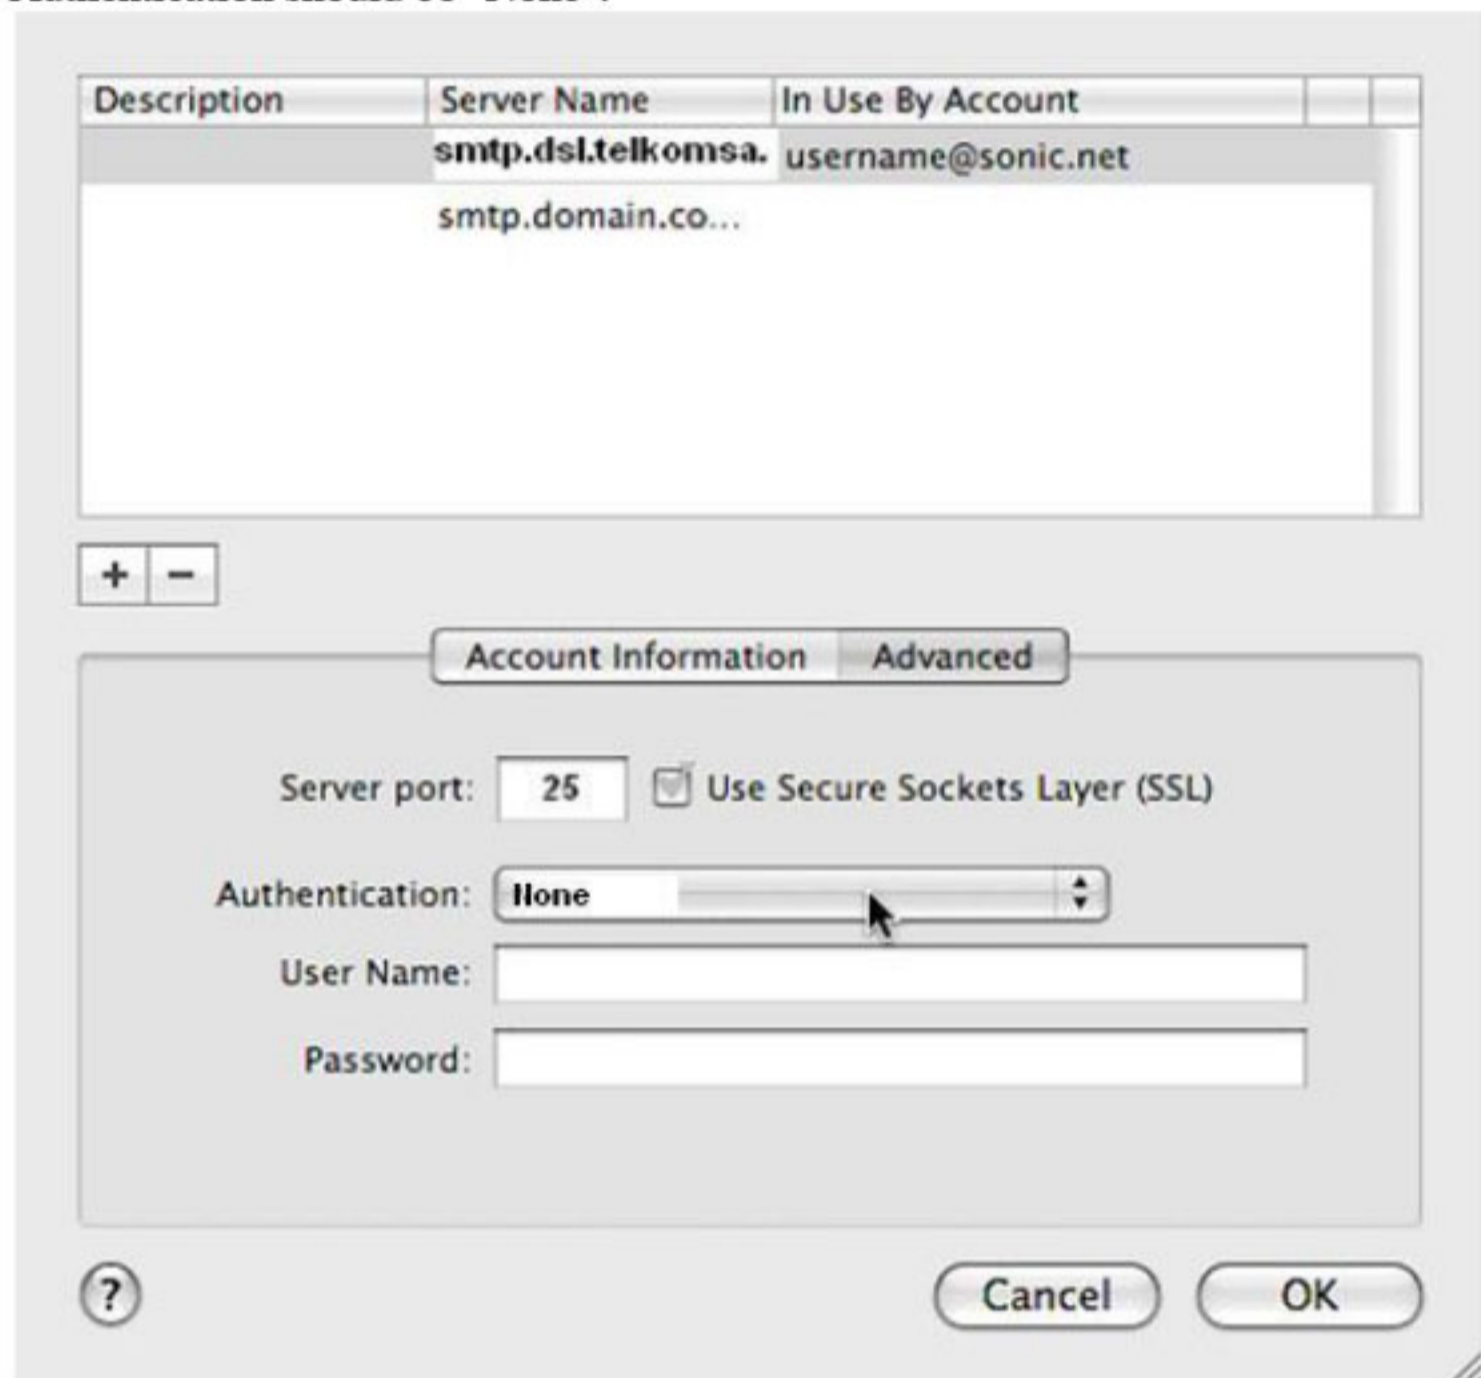

- o "Password" is the password for your telkomsa.net login name.

Note: to add additional mail accounts, click the "+" button on the lower-left.

- o You can edit the Outgoing Mail Server by opening the Outgoing Mail Server (SMTP) pull-down menu, selecting "Edit server list," then selecting the "Advanced" tab.
 1. The "Server Name" should be **smtp.dsl.telkomsa.net** for ADSL users and **smtp.telkomsa.net** for other users..
 2. The "Server port" should be "25," with "Use Secure Sockets Layer (SSL) unchecked.

3. Authentication should be "None".

That's it! Press "OK" and close the account window. You are ready to use Mail for OS X.
